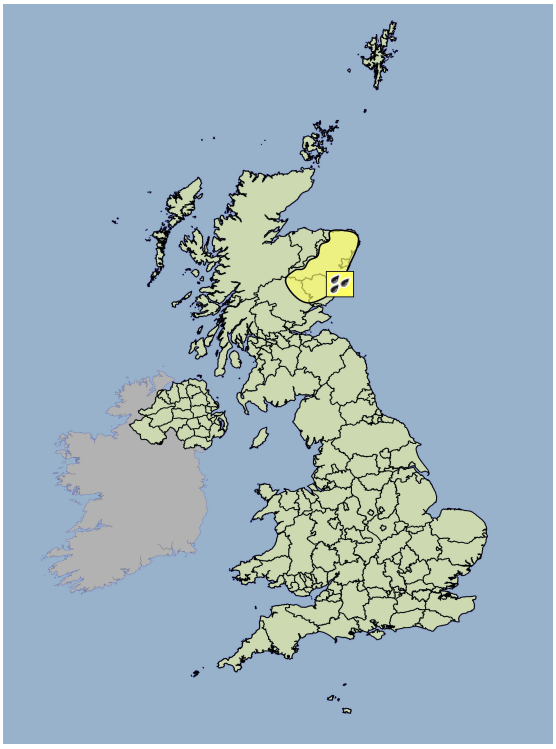
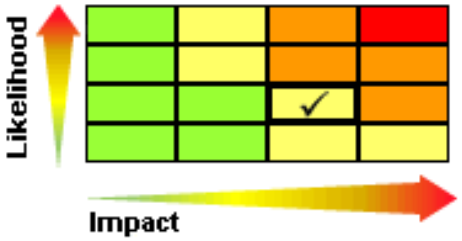
National Severe Weather Warning Service





Chief Forecasters Assessment
A low pressure system is expected to run in from the southwest on Saturday, becoming slow-moving over northern Britain on Sunday. This will push further areas of rain and some hill snow northwards across Scotland on Saturday evening and through early Sunday, before a more showery regime reaches most of this area by Sunday afternoon. The initial band of rain looks as if it will move through quite quickly but taken together with the showers that follow, there could still be 10-20 mm quite widely, and more than 30 mm in some places. Some uncertainties in rainfall detail persist, with a further update likely to be issued early on Sunday.

The Met Office have issued a **Yellow Warning** of **Rain**

Valid from **18:00 on Sat, 09th Jan 2016** until **18:00 on Sun, 10th Jan 2016**

Areas of rain are expected to move northwards across eastern Scotland on Saturday evening, clearing during Sunday morning but with heavy showers affecting parts of the warning area in the afternoon and early evening.

This is an update to draw attention to the fact that latest information is perhaps suggesting a little less rainfall overall across the north of the warning area but further south, the risk of heavy showers has led to the end time being moved into the evening period. Please be aware that with saturated ground, the rain and showers may prolong ongoing flooding impact, although they seem unlikely to lead to renewed flooding issues.
